11 errors billing retries

site/user-docs/11-errors-billing-retries.md

11. Errors, billing, retries

HTTP	Zapier mapping	What you should do
400	validation	SHA-256 must be 64 hex chars; supply Data or SHA256.
401	auth	Re-paste API key; it may have been regenerated.
402	QuotaExceeded	Reload prepaid credit in the portal (<code>upgradeUrl</code> in the error).
403	PlanUpgradeRequired	Batch / wait / tree lookup may be paid-only.
404	empty search	Not itemized — try tree-node search before creating a new seal.
504 / pending	timeout	Use the Completed trigger; do not loop wait in the same step.

Middleware retries `jobs.watch` / `jobs.events` once when NATS drops (simulator: enable **recover**). Zapier itself retries failed HTTP according to your Zap settings — keep creates **idempotent** (re-registering the same hash returns the original seal).

Delays: if the simulator flags hops over 200ms, do not raise Zapier's step timeout until chain poll interval and archive query window (`WAIT_ARCHIVE_MS`) are measured on NS1.
